UTHM Industrial Talk

THE TECHNOLOGIES AND ISSUES DISCUSSED IN THE TALK

UTHM's Learning Management System (LMS) is known as AUTHOR. It keeps its data separate from the main student records to make sure the system stays fast and run smoothly. The only downside is that some students sometimes face temporary login issues. Despite this small problem, UTHM team successfully moved the system online, allowing students to access their materials anywhere.

Next, UTHM provides technologies such as Single sign on and 2-factor authentication (2FA) to log in to most of their system. These technologies have been developed to improve user convenience where students and staff can just log in once and they can access multiple system, and it also can reduce problem such as forgotten password. By applying 2FA in the system, it can enhance security because even a log in password is correct, it still required confirmation from another factor.

Another technology discussed was UTHM's use of APIs to enable data sharing between departments. This allows systems to integrate efficiently without data duplication, improving accuracy and system performance. The talk also highlighted UTHM's migration from a client-server architecture to a web-based server to overcome scalability and accessibility issues. This transition aims to enhance user experience, encourage a strong digital culture, and ensure the university keeps up with the latest technology.

SUMMARY OF THE TALK

The industrial talk gave us a clear and engaging overview of UTHM's ICT journey, starting from the KUITTHO to the development of their 2025 Enterprise Architecture. The speakers walked us through the four main pillars of their strategy which is strengthening ICT Infrastructure, enhancement of integrated applications, improving personnel skills and collaborative & dynamic ICT governance. Speaker also shared the real challenges they face to upgrade ICT services with long-term planning in a large academic environment. Our visit ended with a tour of their tier 3 data centre. We got to see the Hot and Cold Aisle setup in the data center, which helps control airflow and prevents equipment from overheating. Overall, the session gave us a practical look into how ICT is managed in UTHM.

REFLECTION

CHOH JING YI (A23CS0296) : In this industry visit, I learned about data centre technologies used like the Hot and Cold Aisle setup. I learned about the specific technologies used in the data center like the Hot and Cold Aisle setup which is crucial for the data center's efficiency and sustainability. I also gained a deeper understanding of UTHM's Enterprise Architecture and their migration from legacy systems. This improves the daily lives of students and staff by ensuring reliable access to academic data.

NUR FIRZANA (A23CS0156): From this visit, I gained insight that effective innovation serves as the backbone of human progress. The tour of UTHM's data center revealed how the engineering solutions like the Hot and Cold Aisle setup. They significantly reduce energy consumption, directly contributing to a greener environment for community. Seeing their transition showed that the strong ICT infrastructure is necessary for human life, as it guarantees uninterrupted access to knowledge and resources, ensuring that the system run smoothly for students and staff.

YASMIN BATRISYIA (A23CS0201): From visiting UTHM, I learned how enterprise architecture is applied across the entire university, involving everyone from students to administrative staff. I also gained insights into their migration toward a web-based architecture, their core strategies, and their data center technologies such as how they use different types of aisles to create a more efficient and sustainable data center. Through this experience, I enhanced my understanding of enterprise architecture and how data center technology is evolving today.

SYARIFAH DANIA (A23CS0183): From the industry visit to UTHM, I learned how data is shared between departments using APIs to ensure efficient system integration. The visit also highlighted UTHM's migration from a client-server system to a web-based architecture to overcome scalability and accessibility challenges. The goals of this migration include enhancing user experience, fostering a strong digital culture, and keeping up with the latest technology. Overall, the visit helped me understand the importance of effective enterprise architecture in supporting reliable academic and administrative services.
